

## Contact Management project

### **futures:**

create update see & remove a Contact

same for groups

manage relation between groups & contacts form the side of each other.

### **Skills:**

MVC: improve skill of creating mvc model to update concerned interfaces after any changes in the data

OOP: improve object oriented programming mindset & specified the relation between objects

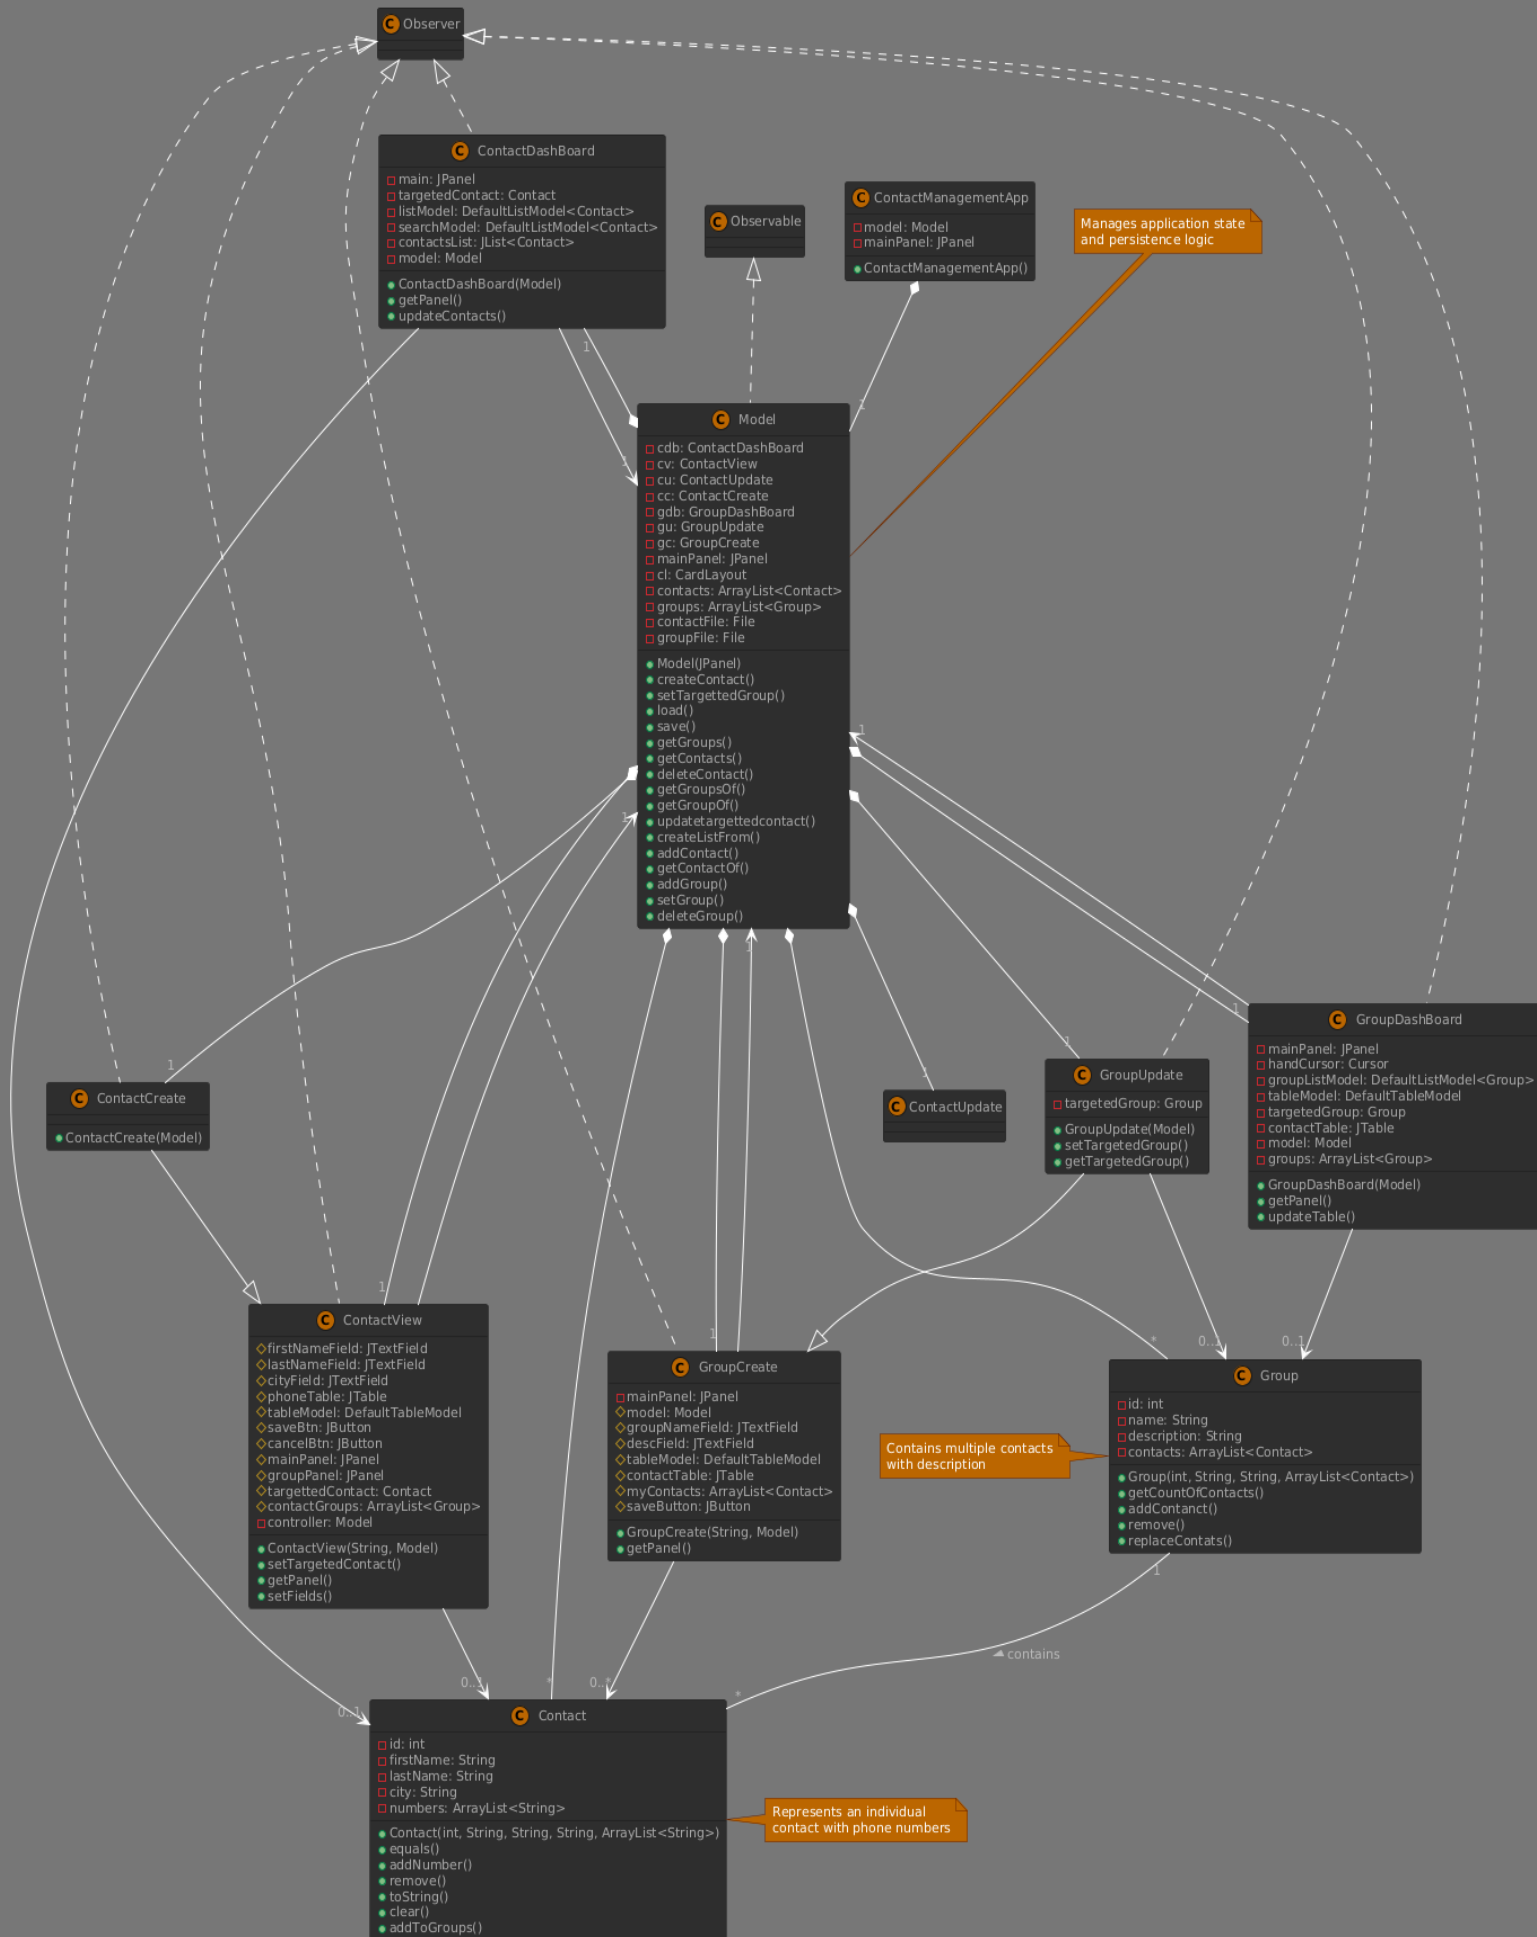

Design: simulating the famous programs design improve my taste in design

patience & quietness: facing problems & solving them before a dead line makes me more patient & quiet

### **futures can be added:**

relate the application to a db & add a messages & calling futures to learn networking & maybe API

**UML:** page below

### Model :

**public void createContact(String fname, String lname, String city, DefaultTableModel phones, ArrayList<Group> groups):**

create a Contact form these attributes after casting the phone Model & add the new contact in the groups refereed by the groups ArrayList

**public void setTargettedGroup(Group targetedGroup):**

set the targeted group of the update panel & the delete button

**private void setMainPanel():** set the main Panel layout to card Layout & add the panels to the

 card

**public void load() :** load contacts & groups form files

**private void loadGroups() :** load groups **included** int the load function

**private Contact getContactsOfId(int contact Id)** return a reference to the contact that has the same id form the contacts Array

**private void loadContacts():** load contacts form file , included in the load function

**public void save():** save the contacts & groups array lists in files

**private void saveContacts()**

**private void saveGroups()**

**public ArrayList<Group> getGroups() :** return the groups list in **a new array to save original**

data

+ **ArrayList<Contact> getContacts():** same as get **Groups**

+ **void deleteContact(Contact c):** remove contact form groups & then delete it

- **void removeContactFromGroups(Contact c)**

+ **ArrayList<Group> getGroupsOf(Contact contact):** loop over groups & collect the groups that contain the parameter in a list

+ **Group getGroupOf(int id)** return the group with the id = id ?

+ **void updatetargettedcontact(String fname, String lname, String city, DefaultTableModel phones, ArrayList<Group> groups2, Contact targettedContact)**

after updating the data in the update contact panel & clicking SAVE we update the actual data of the contact

+ **ArrayList<String> createListFrom(DefaultTableModel phones):** cast the model to List <String>

+ **void addContact(Contact contact)**

- **int getMaxContactId():** get the last id & gave it to new Contact after adding 1

+ **Contact getContactOf(int id):** return the contact with id = id

+ **void addGroup(Group g)**

- **int getMaxGroupId():** same as get Max Contact Id

+ **void setGroup(Group targetedGroup, Group g)** copy data form the g to the targeted Group other the id

+ **void deleteGroup(Group group)**

**ContactDashBoard .updateContacts() :** clear the J list that shows the contacts & reload them form the model.contacts called in the constructor & in the update method

**GroupDashBoard .fillList():** clear the Jlist & load the groups form model .groups

**.updateTable():** if the targeted group has deleted or updated we update the table that shows its details

**ContactView :** public void **setEnabled():** enable fields to be updated , called in the update Contact & the create Contact sub classes

**setFields()**: set fields with corresponding data , used in the view & update to show the data of the targeted contact

**clearFields()**: if the targeted contact has deleted we clear fields

**loadGroups()**: load all Groups in a Panel as check boxes & set their selected attribute depending on the contact gorups

**GroupCreate:**

**loadContacts()**: load all Contact in a J table

\*\*\*\*\* *Apologies* \*\*\*\*\*

*I'm sorry since the code is overlapping & not too organized after updating the code many times & redesign it.*
